Utilizando transformada Z para resolver um problema de recorrência

Péricles Lopes Machado

July 25, 2016

Abstract

Neste artigo, a transformada Z é utilizada na resolução do problema:

$$
\begin{aligned}
F(0) &= 0, \text{ para } n \leq 0 \\
F(n) &= \frac{1}{n^2} \sum_{0 \leq k < n} \left[\sum_{0 \leq i < k} [1 + F(k)] + 1 + \sum_{k \leq i < n} [1 + F(n-1-k)] \right], \text{ para } n > 0
\end{aligned}
$$

(1)

1 Resolução

Simplificando-se a eq. (1):

$$
\begin{aligned}
n^2 F(n) &= n + \sum_{0 \leq k < n}[k + kF(k)] + \sum_{0 \leq k < n}[n - k + (n-k)F(n-1-k)] \\
n^2 F(n) &= n + \sum_{0 \leq k < n}[k] + \sum_{0 \leq k < n}[kF(k)] + \sum_{0 \leq k < n}[n-k] + \sum_{0 \leq k < n}[(n-k)F(n-1-k)] \\
n^2 F(n) &= n + \sum_{0 \leq k < n}[n] + 2 \sum_{0 \leq k < n}[kF(k)] \\
n^2 F(n) &= (n^2 + n) + 2 \sum_{k \geq 0} kF(k)u(n-1-k)
\end{aligned}
$$

(2)

obtém-se:

$$
n^2 F(n) = (n^2 + n) + 2\left[nF(n)\right] * \left[u(n-1)\right], \tag{3}
$$

onde $u(n) = 1$, para $n \geq 0$ e $u(n) = 0$, para $n < 0$.

Aplicando a transformada $\mathcal{Z}$ em (3) e fazendo $Y = \mathcal{Z}\{F(n)\}$:

$$
z^2 \frac{d^2}{dz^2} Y = \mathcal{Z}\left\{n^2 + n\right\} - 2z \frac{d}{dz} Y \mathcal{Z}\left\{u(n-1)\right\}
$$

$$
z^2 \frac{d^2}{dz^2} Y = \mathcal{Z}\left\{n^2 + n\right\} - 2z \left(\frac{z^{-1}}{1 - z^{-1}}\right) \frac{d}{dz} Y
$$

$$
z^2 \frac{d^2}{dz^2} Y = \mathcal{Z}\left\{n^2\right\} + \mathcal{Z}\left\{n\right\} - \left(\frac{2z}{z - 1}\right) \frac{d}{dz} Y
$$

$$z^2 \frac{d^2}{dz^2}Y = \frac{z^{-1}(1+z^{-1})}{(1-z^{-1})^3} + \frac{z^{-1}}{(1-z^{-1})^2} - \left(\frac{2z}{z-1}\right)\frac{d}{dz}Y$$

$$z^2 \frac{d^2}{dz^2}Y = \frac{z^2(1+z^{-1})}{(z-1)^3} + \frac{z}{(z-1)^2} - \left(\frac{2z}{z-1}\right)\frac{d}{dz}Y$$

$$z^2 \frac{d^2}{dz^2}Y = \frac{z(z+1)}{(z-1)^3} + \frac{z}{(z-1)^2} - \left(\frac{2z}{z-1}\right)\frac{d}{dz}Y$$

$$z^2 \frac{d^2}{dz^2}Y = \frac{z(z+1)}{(z-1)^3} + \frac{z(z-1)}{(z-1)^3} - \left(\frac{2z}{z-1}\right)\frac{d}{dz}Y$$

$$z^2 \frac{d^2}{dz^2}Y = \frac{2z^2}{(z-1)^3} - \left(\frac{2z}{z-1}\right)\frac{d}{dz}Y$$

$$\frac{d^2}{dz^2}Y = \frac{2}{(z-1)^3} - \left(\frac{2}{z(z-1)}\right)\frac{d}{dz}Y$$

Por fim,

$$\frac{d^2}{dz^2}Y = \frac{2}{(z-1)^3} - \left(\frac{2}{z(z-1)}\right)\frac{d}{dz}Y. \tag{4}$$

Resolvendo a equação diferencial (4), usando o *WolframAlpha*:

$$
\begin{aligned}
Y(z) = (c_1 z^2 + \\
2\log(1-z)((c_1-2)z - c_1 + z^2 - 2(z-1)\log(z)) - \\
c_1 z - c_1 + 2(-2(z-1)Li_2(z) + z^2(-\log(z)) + z + \\
(z-1)\log^2(1-z) + \\
2z\log(z) - 3))/(z-1) + \\
c_2
\end{aligned}
\tag{5}
$$

Expandindo a eq. (5):

$$
\begin{aligned}
Y(z) = \\
\frac{c_1 z^2}{z-1} - \frac{c_1 z}{z-1} - \frac{c_1}{z-1} + \\
\frac{2c_1 z\log(1-z)}{z-1} - \frac{2c_1\log(1-z)}{z-1} + \\
c_2 - \\
\frac{4z Li_2(z)}{z-1} + \frac{4 Li_2(z)}{z-1} + \\
\frac{2z^2\log(1-z)}{z-1} - \frac{2z^2\log(z)}{z-1} + \\
\frac{2z}{z-1} - \\
\frac{6}{z-1} + \\
\frac{2z\log^2(1-z)}{z-1} - \frac{2\log^2(1-z)}{z-1} - \\
\frac{4z\log(1-z)}{z-1} - \\
\frac{4z\log(1-z)log(z)}{z-1} + \\
\frac{4\log(1-z)log(z)}{z-1} + \\
\frac{4z\log(z)}{z-1}
\end{aligned}
\tag{6}
$$
